Functions and Statements - Lab

Problems with exercise and homework for the "JS Front-End" Course @ SoftUni.

1. Format Grade

Write a function that receives a grade between 2.00 and 6.00 and prints a formatted line with grade and description.

- < 3.00 "Fail"
- >= 3.00 and < 3.50 "**Poor**"
- >= 3.50 and < 4.50 "**Good**"
- >= 4.50 and < 5.50 "Very good"
- >= 5.50 "Excellent"

Examples

Input	Output
3.33	Poor (3.33)
4.50	Very good (4.50)
2.99	Fail (2)

Hints

• Use a series of **if** statements checking the threshold between grade brackets

```
function formatGrade(grade) {
if (grade < 3.00) {
    console.log('Fail (2)');
} else if (grade < 3.5) {
    console.log(`Poor (${grade.toFixed(2)})`);
// TODO: Add other conditions
```

2. Math Power

Write a function that calculates and print the value of a number raised to a given power:

Examples

Input	Output
2,8	256
3,4	81

Create a function that will have **two parameters** - the **number** and the **power**.

Print the result to the console.

3. Repeat String

Write a function that receives a string and a repeat count n. The function should return a new string (the old one repeated n times).

Examples

Input	Output
"abc", 3	abcabcabc
"String", 2	StringString

Hints

- 1. Use a loop or another method to repeat the input string.
- 2. Use the return operator to produce the result.

4. Orders

Write a function that calculates the total price of an order and prints it on the console. The function should receive one of the following products: coffee, coke, water, snacks; and a quantity of the product. The prices for a single piece of each product are:

- coffee 1.50
- water 1.00
- coke 1.40
- snacks 2.00

Print the result formatted to the second decimal place.

Example

Input	Output
"water", 5	5.00
"coffee", 2	3.00

Hints

- Create a function and pass the two variables in.
- Print the result in the function.

5. Simple Calculator

Write a function that receives three parameters – two numbers and an operator (string) – and calculates the result depending on the operator. Operator can be 'multiply', 'divide', 'add' or 'subtract'. Try to solve this task using arrow functions.

Bonus

Solve this task without using any conditional statements (no if or switch statements or ternary operators).

Input

The input comes as parameters named **numOne**, **numTwo**, **operator**.

Examples

Input	Output
5, 5, 'multiply'	25
40, 8, 'divide'	5
12, 19, 'add'	31
50, 13, 'subtract'	37

Hints

• Use a **switch** statement for the different operators.

6. Sign Check

Write a function, that checks whether the result of the multiplication **numOne * numTwo * numThree** is positive or negative. Try to do this **WITHOUT** multiplying the 3 numbers.

Input

The input comes as parameters named numOne, numTwo, numThree.

Output

- If the result is positive, print on the console -> "Positive"
- Otherwise, print -> "Negative"

Example

Input	Output
5, 12, -15	Negative
-6, -12, 14	Positive
-1, -2, -3	Negative

-5,	Negative
1,	
1	

Hints

- Consider how the sign of each of the three input parameters will affect their product.
- Check all the different combinations for the three numbers.
